VLAT / PUBLIC MARKET DOCUMENTATION

Website Privacy Notice

Observed data flows for a static market website, embedded external charts and visitor-controlled market navigation.

PUBLICATION STATUS: OPERATOR REVIEW REQUIRED BEFORE REPRESENTING THIS DOCUMENT AS FINAL OR LEGALLY COMPLETE.

01 / Coverage and Current Implementation

This notice describes the intended data practices of the public informational market pages provided at thebreakroom.xyz. The current build is designed as a static frontend. No customer account registration, token-custody facility, wallet-signing integration, private-key collection or newsletter submission is implemented in the supplied static source.

This notice should be reconciled with the actual hosting platform, enabled server logs, cookie settings, content delivery infrastructure and any services added before public deployment. No claim that a visitor is completely anonymous is made.

02 / Technical and Network Data

Ordinary visits to an internet-hosted site typically disclose network metadata, such as IP address, browser identifiers, request times and requested resource paths, to the hosting platform or intermediaries required to deliver content. The operator must inspect actual hosting-provider retention and access practices before finalizing this notice.

The present static source does not intentionally upload a visitor's wallet address to an operator-operated database, but any future wallet-view or account feature would require a revised notice reflecting actual data flow.

03 / External Market Data, Charts and Fonts

When market data is available, the page requests public Solana-market information from DEX Screener. A DEX Screener chart frame may be embedded in the page when an official market has been verified and selected. Embedded-content providers can receive browser requests and may operate their own cookies, logging or identifiers under their own policies.

The page loads its selected web fonts through Google Fonts when network connectivity permits. These requests, and use of external Solana blockchain explorers or trading venues, are subject to those third parties' separate data practices. The site operator does not control every third-party tracking technology.

04 / Local Page Behavior and Storage

The supplied frontend does not intentionally create local user accounts, persist secret information, or store tokens or private keys. It performs periodic market-data refresh while the page is visible. Browser caches and third-party embedded content may nevertheless use normal browser storage in accordance with browser and provider behavior.

The site can present outbound links to external terminals for trade execution. A visitor voluntarily leaving this site is subject to the destination provider's privacy notice and transaction flow.

05 / Data Retention, Rights and Contact

Any retention periods, privacy-rights procedures, cross-border transfer descriptions, service-provider categories and contact mechanism must be confirmed against the actual hosting and data processing configuration. No fictitious operator address, Data Protection Officer or privacy contact is provided.

Privacy rights vary by jurisdiction; visitors may have statutory access, deletion, correction or other rights in relation to information actually processed by the responsible operator. Applicable rights and contact instructions must be accurately published once operator details are confirmed.

06 / Review Prior to Publication

This document is an implementation-specific drafting baseline, not a verified representation of an unknown hosting stack or a final jurisdiction-specific statutory privacy notice. Before live release, confirm actual cookies, analytics, embedded scripts, logging, retention, service-provider terms, request mechanisms and required consent configuration.

Version 1.0, draft prepared 26 October 2026.
